Table 2. Assessment Determination

Assessment Determination

Cod has been categorised by the IUCN Red List as Vulnerable, and does not appear in the CITES appendices. Northern Norwegian coastal cod is managed relative to a reference point established in an international management plan, and was therefore assessed under Category C.

The most recent stock assessment was carried out in 2024 and utilised all commercial and recreational catch and bycatch data. The assessment concluded that stock biomass is above the reference point established by the management plan. For these reasons the byproduct continues to meet the MT requirements and should remain approved for use as a raw material.

Fishery Assessment Peer Review Comments

The by-product fishery under assessment is the Cod (*Gadus morhua*) caught with demersal trawls, gillnets and longlines in ICES Subareas 1 & 2 North of 67°N (Northern Norwegian coastal cod), FAO area 27. The species is classified as Vulnerable by the IUCN. The species is managed relative to biomass-based reference points and therefore it is assessed under category C.

The most recent stock assessment conducted for cod by the ICES Arctic Fisheries Working Group (AFWG) in 2024 indicated that SSB was above the limit reference point (SSB_{lowerbound}) established by the management plan in place. Therefore, it passes category C.

The peer review supports the auditor's recommendation to pass the cod caught with demersal trawls, gillnets and longlines in ICES Subareas 1 & 2 North of 67oN (Northern Norwegian coastal cod, under the Marin Trust IFFO RS v2.0 by-fishery standard for the production of fishmeal and fish oil.

Species Categorisation

NB: If any species is categorised as Endangered or Critically Endangered on the IUCN Red List, or if it appears in CITES Appendix 1, it **cannot** be approved for use as an MarinTrust raw material.

IUCN Red list Category

By-product material from a species listed by IUCN (the International Union for Conservation of Nature) under the Red List for the following categories shall immediately fail the assessment;

- EXTINCT (E) AND EXTINCT IN THE WILD (EW)
- CRITICALLY ENDANGERED (CR) facing an extremely high risk of extinction in the wild.
- ENDANGERED (EN) facing a very high risk of extinction in the wild.

By-product material may be used from the following categories provided that all clauses in the MarinTrust standard are passed.

- VULNERABLE (VU) facing a high risk of extinction in the wild.
- NEAR THREATENED (NT) does not qualify for above now, but is close or is likely to qualify for, a threatened category in the near future.
- LEAST CONCERN (LC) Widespread and abundant.
- DATA DEFICIENT (DD) and NOT EVALUATED (NE)

CATEGORY C SPECIES

In a by-product assessment, Category C species are those which are subject to a species-specific management regime and are usually targeted species in fisheries for human consumption.

Clause C1 should be completed for each Category C species. If there are no Category C species in the fishery under assessment, this section can be deleted. Where a species fails this Clause, it should be assessed as a Category D species instead.

| Spe | ecies | Name | Cod (Gadus morhua) | |
|-----------|-------|-----------------|--|------|
| C1 | Categ | ory C Stock Sta | atus - Minimum Requirements | |
| CI | C1.1 | - | ovals of the species in the fishery under assessment are included in the stock assessment are considered by scientific authorities to be negligible. | PASS |
| | C1.2 | reference po | s considered, in its most recent stock assessment, to have a biomass above the limit int (or proxy), OR removals by the fishery under assessment are considered by scientific be negligible. | PASS |
| | | | Clause outcome: | PASS |

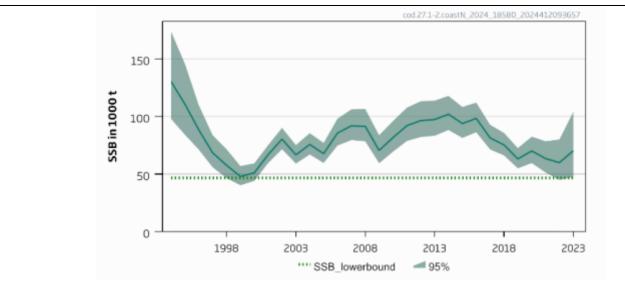

C1.1 Fishery removals of the species in the fishery under assessment are included in the stock assessment process, OR are considered by scientific authorities to be negligible.

Northern Norwegian coastal cod is subject to annual stock assessment by the ICES Arctic Fisheries Working Group (AFWG). The most recent assessment was an age-based analytical assessment conducted in 2024, which used catches in the model and forecast. The stock assessment included commercial and recreational landings data and bycatch, and ICES considers discarding to be negligible. The 2024 catch advice notes several potential sources of uncertainty; however overall the results of the assessment are considered reliable (ICES 2024). C1.1 is met.

C1.2 The species is considered, in its most recent stock assessment, to have a biomass above the limit reference point (or proxy), OR removals by the fishery under assessment are considered by scientific authorities to be negligible.

The 2024 catch advice includes an indication of the current status of the cod stock relative to reference points. Although there are no MSY or precautionary approach based reference points established for the stock, the reference point SSB_{lowerbound} has been established by the management plan for the stock as "the limit above which the management plan is considered precautionary" (ICES 2024). The value for SSB_{lowerbound} is 46,723t, and the most recent stock assessment included a short-term forecast for SSB in 2024 of 61,030t. The catch advice states that "spawning-stock size is above SSB_{lowerbound}" (ICES 2024). C1.2 is met.

Northern Norwegian coastal cod, estimated SBB relative to current reference point SSB_{lowerbound} (ICES 2024)

CATEGORY D SPECIES

Category D species are those which are not subject to a species-specific management regime. In the case of mixed trawl fisheries, Category D species may make up the majority of landings. The comparative lack of scientific information on the status of the population of the species means that a risk-assessment style approach must be taken.
